

Dynamic Page, Row and Column Generation

Pivotier uses your G/L Account and Dimension Value set-up data to automatically create report pages, rows and columns. Report rows can also be generated using your existing Account Schedule lines while creating pages and columns based on easy “single-click” options. Report columns can be created for actual/budget data, variances and also prior period values.

Rollup “Trees”

Your indentation levels in Dimension Values and Chart of Accounts can be used to generate summary pages or rows. Now you may create logical roll-up structures against your dimensions to easily generate summarized information.

Font Formatting Options

Microsoft’s Report Definition Language and the Microsoft Report Viewer are capable of supporting rich-content reports, including charts and graphics. Pivotier reveals all these sophisticated formatting capabilities to end users via Style Sheets inside Dynamics NAV. Style Sheets can be used to define font colors, weight, families, justification and other characteristics such as printing negative numbers in red.

Protecting your Data

You know better than anyone that all users should not have unrestricted access to data. Because Pivotier starts within Dynamics NAV, it respects all your NAV security roles and permissions. Using external tools exposes your data to uncontrolled access.

Sharing and Distributing Reports

Your company has people who need reports and may not be day-to-day NAV users. Adding user sessions can be an expensive proposition and training dozens of casual users can become impossible to sustain. All Pivotier reports can be published to SQL Server Reporting Services (SSRS), and then run by users with a lower cost SQL user connection to your data. SSRS also allows you to define subscription rules to automatically execute and distribute reports via email or file transfer.

All reports can also be saved directly to Excel and PDF, or emailed directly using our mail client. Published reports allow drill-down to NAV data.
